

# PDF Form Field Replacement

This PDF demonstrates how we replace form fields in a PDF.

We attempted to find and replace:

**Original Text: "1"**

**Replacement Text: "uma"**

## Technical details:

- The PDF has 13 pages
- The PDF has 0 form fields
- We tried multiple field name formats: 1, {1}, etc.

## In a real implementation with a properly structured PDF form:

1. We would find the form field by name
2. Set its text value using: `field.setText(newValue)`
3. Save the PDF with the modified form field

## Note about this specific PDF:

This PDF appears to not have editable form fields that can be directly modified.

For a production solution, you would need to either:

1. Get a version of the PDF with proper form fields
2. Use a more advanced PDF manipulation library that can modify content streams
3. Use a specialized PDF form-filling service
